How can I reduce Subset Sum to Partition?

Maybe this is quite simple but I have some trouble to get this reduction. I want to reduce [Subset Sum](#) to [Partition](#) but at this time I don't see the relation!

Is it possible to reduce this problem using a Levin Reduction ?

If you don't understand write for clarification!

complexity-theory

np-complete

reductions

Let (L, B) be an instance of subset sum, where L is a list (multiset) of numbers, and B is the target sum. Let $S = \sum L$. Let L' be the list formed by adding $S+B, 2S-B$ to L .

(1) If there is a sublist $M \subseteq L$ summing to B , then L' can be partitioned into two equal parts: $M \cup \{2S-B\}$ and $L \setminus M \cup \{S+B\}$. Indeed, the first part sums to $B + (2S-B) = 2S$, and the second to $(S-B) + (S+B) = 2S$.

(2) If L' can be partitioned into two equal parts P_1, P_2 , then there is a sublist of L summing to B . Indeed, since $(S+B) + (2S-B) = 3S$ and each part sums to $2S$, the two elements belong to different parts. Without loss of generality, $2S-B \in P_1$. The rest of the elements in P_1 belong to L and sum to B .

But the standard subset-sum problem uses all integers, and partition problem uses just non-negative integers... – [Harold](#) Apr 19 at 17:40

SUBSET-SUM is NP-complete even with non-negative integers, for example the reduction from 3SAT ends up with non-negative integers. Also, there is probably a direct reduction from integer SUBSET-SUM to non-negative integer SUBSET-SUM. – [Yuval Filmus](#) Apr 19 at 20:26

Yes, I know, and this reduction is very easy. Just noting that it isn't the subset sum in it's "default" form. :) – [Harold](#) Apr 20 at 3:11

Subset Sum:

Input: $\{a_1, a_2, \dots, a_m\}$ s.t $M = \{1..m\}$ and a_i are non negative integer and $S \subseteq \{1..k\}$ and $\sum_{i \in S} a_i = t$

Partition:

Input: $\{a_1, a_2, \dots, a_m\}$ and $S \subseteq \{1, \dots, m\}$ s.t $\sum_{i \in S} a_i = \sum_{j \notin S} a_j$

Partition Np Proof: if prover provides a partitions(P_1, P_2) for verifier, verifier can easily calculate the sum of P_1 and P_2 and check if the result is 0 in linear time.

NP_Hard: SubsetSum \leq_p PARTITION

Let x be input of SubsetSum and $x = \langle a_1, a_2, \dots, a_m, t \rangle$ and $\sum_{i=1}^m a_i = a$

Case 1: $2t \geq a$:

Let $f(x) = \langle a_1, a_2, \dots, a_m, a_{m+1} \rangle$ where $a_{m+1} = 2t - a$

We want to show that $x \in \text{SubsetSum} \Leftrightarrow f(x) \in \text{PARTITION}$

so there exist $S \subseteq \{1, \dots, m\}$ s.t $T = \{1, \dots, m\} - S$ and $\sum_{i \in T} a_i = a - t$

and Let $T' = \{1, \dots, m, m+1\} - S$ so $\sum_{j \in T'} a_j = a - t + 2t - a = t$

which is exactly $\sum_{i \in S} a_i = t$ and it shows $f(x) \in \text{PARTITION}$

now We also will show that $f(x) \in \text{PARTITION} \Leftrightarrow x \in \text{SubsetSum}$

so there exist $S \subseteq \{1, \dots, m, m+1\}$ s.t $T = \{1, \dots, m, m+1\} - S$ and $\sum_{i \in T} a_i = [a + (2t - a) - t] = t$

and it shows $\sum_{i \in T} a_i = \sum_{j \in S} a_j$ so $m+1 \in T$ and $S \subseteq \{1, \dots, m\}$ and $\sum_{i \in S} a_i = t$

so $x \in \text{SubsetSum}$

Case 2: $2t \leq a$:

we can check same but just this time a_{m+1} is $a - 2t$
