Turing Machine encodings

- (i) Every Turing Machine $M = (K, \Sigma, \delta, s)$ can be represented as a number in b -ary notation, where $b = |K| + |\Sigma|$.
- (ii) Therefore, configurations can be encoded as *sequences* of integers in b -ary representation.
- (iii) The "yields in one step" function over configurations of a Turing Machine, defines a relation $Y_M \subseteq \mathcal{N}^2$

Goal

To formulate a first-order expression $yields_M(x, y)$ in number theory, over the free variables x and y , such that

$\mathbf{N}_{x=m, y=n} \models yields_M(x, y)$ iff $Y_M(m, n)$.

Turing Machine encodings

- (i) Every Turing Machine $M = (K, \Sigma, \delta, s)$ can be represented as a number in b -ary notation, where $b = |K| + |\Sigma|$.
- (ii) Therefore, configurations can be encoded as *sequences* of integers in b -ary representation.
- (iii) The "yields in one step" function over configurations of a Turing Machine, defines a relation $Y_M \subseteq \mathcal{N}^2$

Goal

To formulate a first-order expression $yields_M(x, y)$ in number theory, over the free variables x and y , such that

$\mathbf{N}_{x=m, y=n} \models yields_M(x, y)$ iff $Y_M(m, n)$.

Turing Machine encodings

- (i) Every Turing Machine $M = (K, \Sigma, \delta, s)$ can be represented as a number in b -ary notation, where $b = |K| + |\Sigma|$.
- (ii) Therefore, configurations can be encoded as *sequences* of integers in b -ary representation.
- (iii) The "yields in one step" function over configurations of a Turing Machine, defines a relation $Y_M \subseteq \mathcal{N}^2$

Goal

To formulate a first-order expression $yields_M(x, y)$ in number theory, over the free variables x and y , such that

$\mathbf{N}_{x=m, y=n} \models yields_M(x, y)$ iff $Y_M(m, n)$.

Turing Machine encodings

Goal

To formulate a first-order expression $yields_M(x, y)$ in number theory, over the free variables x and y , such that

$\mathbf{N}_{x=m, y=n} \models yields_M(x, y)$ iff $Y_M(m, n)$.

Formulating the encoding technique

$p \in K,$	$\sigma \in \Sigma$	$\delta(p, \sigma)$
s	a	(s, a, \rightarrow)
s	b	(s, b, \rightarrow)
s	\sqcup	(q, \sqcup, \leftarrow)
s	\triangleright	$(q, \triangleright, \rightarrow)$
q	a	(q, \sqcup, \leftarrow)
q	b	$(\text{"no"}, b, -)$
q	\triangleright	$(\text{"yes"}, \triangleright, \rightarrow)$

Table: A Turing Machine that accepts a^*

Example

Consider the $C_1 = (q, \triangleright aa, \sqcup \sqcup)$ and the configuration that follows

$C_2 = (q, \triangleright a, \sqcup \sqcup \sqcup)$. The corresponding encodings $m = 022711_8$ and 027111_8 are related under Y_M .

Observation

- (i) m and n are identical, except for the replacement of 271_8 in m , by 711_8 in n .
- (ii) But this corresponds to Rule 5 in the table! Thus, every move is a local replacement of digits.

 \end{aligned}$$

Auxiliary expressions

Similar expressions can be written for $\text{pads}_M(x, x')$ (x' is obtained from x by adding a \square) and $\text{conf}_M(x)$ (the b -ary representation of x correctly encodes a configuration of M).

A first-order Number-Theoretic expression for Computation (contd.)

Observation

Whole computations of M can be encoded!

Lemma

For each Turing machine M , we can construct a bounded expression $\text{comp}_M(x)$ in number theory such that: $\forall n \in \mathcal{N}, \mathbf{N}_{x=n} \models \text{comp}_M(x) \leftrightarrow$ the b -ary representation of n is the juxtaposition of consecutive configurations of a halting computation of M , starting from the empty string.

Recursive Inseparability

Definition

Two languages L_1 and L_2 are said to be recursively inseparable, if there does not exist a recursive language R such that $L_1 \cap R = \emptyset$ and $L_2 \subset R$.

Theorem

Let $L_1 = \{M : M(M) = \text{"yes"}\}$ and $L_2 = \{M : M(M) = \text{"no"}\}$. L_1 and L_2 are recursively inseparable.

Corollary (Inseparability of halting on empty string)

Let $L_y = \{M : M(\epsilon) = \text{"yes"}\}$ and $L_n = \{M : M(\epsilon) = \text{"no"}\}$. L_y and L_n are recursively inseparable.

Recursive Inseparability of L_p and L_{US}

Theorem

L_p and L_{US} are recursively inseparable.

Proof.

Main idea: Given an Turing Machine M , we construct an expression ϕ_M such that if $M(\epsilon) = \text{"yes"}$, then $\text{NT} \vdash \phi_M$ and if $M(\epsilon) = \text{"no"}$, then ϕ_M is unsatisfiable.

Assume that there exists an algorithm \mathcal{A} to separate L_p from L_{US} , i.e., \mathcal{A} separates the true properties of integers from the unsatisfiable sentences.

But now we can separate L_T and L_n !

Given an arbitrary Turing machine M , construct ϕ_M and then provide it to \mathcal{A} ! What is ϕ_M ?

$\phi_M = \text{NT} \wedge \psi$, where,

$$\psi = (\exists x)(\text{comp}_M(x) \wedge ((\forall y < x) \neg \text{comp}_M(y)) \wedge \text{mod}(x, b \uparrow 2, b \cdot (|\Sigma| + 1))).$$

ψ states that there exists a smallest integer, which encodes an accepting computation of M . □

ψ states that there exists a smallest integer, which encodes an accepting computation of M . □

Recursive Inseparability (contd.)

Proof (contd.)

- (i) Assume $M(\epsilon) = \text{"yes"}$. There exists a unique computation of M that starts with ϵ and halts in the "yes" state. Thus, there exists a unique integer n , such that $\mathbf{N} \models \text{comp}_M[x \leftarrow n]$. Therefore, $\mathbf{N} \models (\exists x)\text{comp}_M(x)$ and since n is unique,
 $\mathbf{N} \models (\exists x)(\text{comp}_M(x) \wedge ((\forall y < x)\neg \text{comp}_M(y)))$. Since the last two digits of the b -ary expansion of n are $|\Sigma| + 1$ and 0 , we have $\mathbf{N} \models \psi$.
 Observe that ψ can be written as a bounded sentence in prenex form. Thus, $\mathbf{NT} \vdash \psi$ and hence $\mathbf{NT} \vdash \phi_M$. In other words, $M(\epsilon) = \text{"yes"}$ implies $\mathbf{NT} \vdash \phi_M$.
- (ii) Assume that $M(\epsilon) = \text{"no"}$. Using the above argument, we can show that $\mathbf{N} \models \phi'_M$, where

$$\phi'_M = (\exists x')(\text{comp}_M(x') \wedge ((\forall y < x)\neg \text{comp}_M(y)) \wedge \text{mod}(x', b \uparrow 2, b \cdot (|\Sigma| + 2))).$$

Since ϕ'_M can be written as a bounded sentence, $\mathbf{NT} \vdash \phi'_M$. We need to show that ϕ_M and ϕ'_M are inconsistent. But this is obvious! \square

Thus, there exists a unique integer n , such that $\mathbf{N} \models \text{comp}_M[x \leftarrow n]$. Therefore, $\mathbf{N} \models (\exists x)\text{comp}_M(x)$ and since n is unique, $\mathbf{N} \models (\exists x)(\text{comp}_M(x) \wedge ((\forall y < x)\neg\text{comp}_M(y)))$. Since the last two digits of the b -ary expansion of n are $|\Sigma| + 1$ and 0 , we have $\mathbf{N} \models \psi$.

Observe that ψ can be written as a bounded sentence in prenex form. Thus, $\mathbf{NT} \vdash \psi$ and hence $\mathbf{NT} \vdash \phi_M$. In other words, $M(\epsilon) = \text{"yes"}$ implies $\mathbf{NT} \vdash \phi_M$.

- (ii) Assume that $M(\epsilon) = \text{"no"}$. Using the above argument, we can show that $\mathbf{N} \models \phi'_M$, where

$$\phi'_M = (\exists x')(\text{comp}_M(x') \wedge ((\forall y < x)\neg\text{comp}_M(y)) \wedge \text{mod}(x', b \uparrow 2, b \cdot (|\Sigma| + 2))).$$

Since ϕ'_M can be written as a bounded sentence, $\mathbf{NT} \vdash \phi'_M$. We need to show that ϕ_M and ϕ'_M are inconsistent. But this is obvious! \square

Recursive Inseparability (contd.)

Proof (contd.)

- (i) Assume $M(\epsilon) = \text{"yes"}$. There exists a unique computation of M that starts with ϵ and halts in the "yes" state. Thus, there exists a unique integer n , such that $\mathbf{N} \models \text{comp}_M[x \leftarrow n]$. Therefore, $\mathbf{N} \models (\exists x)\text{comp}_M(x)$ and since n is unique, $\mathbf{N} \models (\exists x)(\text{comp}_M(x) \wedge ((\forall y < x)\neg\text{comp}_M(y)))$. Undecidability of some basic problems

Theorem

The following questions, regarding a given sentence ϕ , are undecidable:

- (i) $Is \models \phi?$
- (ii) $Is \vdash \phi?$
- (iii) Does $N \models \phi?$
- (iv) Does $NT \vdash \phi?$

Gödel's Incompleteness Theorem

Theorem

There does not exist a recursively enumerable set of axioms Ξ , such that for all sentences ϕ , $\Xi \vdash \phi$ if and only if $\mathbf{N} \models \phi$.

Proof.

Let L_{pr} denote the set of all proofs from Ξ .

Since Ξ is recursively enumerable, so is L_{pr} : For each expression in the sequence, check whether it is

- (i) a logical axiom,
- (ii) it follows by *modus ponens*,
- (iii) it is in Ξ .

Since L_{pr} is recursively enumerable, there exists a Turing machine that enumerates it. It follows that there exists a Turing Machine that enumerates $\{\phi : \Xi \vdash \phi\}$. By the hypothesis, there exists a Turing machine that enumerates $L_e = \{\phi : \mathbf{N} \models \phi\}$. Hence, L_e is recursively enumerable. Arguing in identical fashion, the language $L_{ne} = \{\phi : \mathbf{N} \models \neg\phi\}$ is recursively enumerable. This means that L_e and L_{ne} are recursive! □

Consequences of Gödel's Incompleteness Theorem

Non-existence

There **cannot** exist a recursively enumerable (much less recursive) set of axioms that captures all and only the true properties of integers. Any sound system **must** be incomplete, i.e., there must exist a true property of integers that cannot be proved by it.

Categorization

The languages $L = \{\phi : \mathbb{N} \models \phi\}$ and $L^c = \{\phi : \mathbb{N} \models \neg\phi\}$ are not recursively enumerable. Thus L and L^c are neither **RE** nor **coRE**!
