Edge Disjoint Path Edge Disjoint Path Satisfiability

### Lovasz Local Lemma

#### Introduction

The Lovasz local lemma generalizes the argument to the case where *n* events are not mutually independent but the dependency is limited.

Edge Disjoint Paths Edge Disjoint Paths Satisfiability

### Lovasz Local Lemma

#### Introduction

The Lovasz local lemma generalizes the argument to the case where *n* events are not mutually independent but the dependency is limited.

An event *E* is mutually independent of the events  $E_1, E_2, \ldots E_n$  if for any subset  $I \subset [1,n]$ ,

 $P(E \mid \cap_{j \in I} E_j) = P(E)$ 

Edge Disjoint Paths Edge Disjoint Paths Satisfiability

### Lovasz Local Lemma

#### Introduction

The Lovasz local lemma generalizes the argument to the case where *n* events are not mutually independent but the dependency is limited.

An event *E* is mutually independent of the events  $E_1, E_2, \ldots, E_n$  if for any subset  $I \subset [1,n]$ ,

$$\mathsf{P}(E \mid \cap_{j \in I} E_j) = \mathsf{P}(E)$$

The dependency between events can be represented in terms of a dependency graph.

Each pair  $i = 1 \dots n$  can choose path from a collection  $F_i$  from m paths

#### Theorem

If any path in  $F_i$  shares edges with no more than k paths in  $F_j$ , where  $i \neq j$  and  $\frac{8 \cdot n \cdot k}{m} \leq 1$ , then there is a way to choose n edge-disjoint paths connecting the n pairs.

#### Proof

Introduction Edge Disjoint Paths Edge Disjoint Paths Satisfiability

## **Edge Disjoint Paths**

#### Note

Let there exist *n* pairs of users need to communicate using edge-disjoint paths on a network.

Each pair  $i = 1 \dots n$  can choose path from a collection  $F_i$  from m paths

#### Theorem

If any path in  $F_i$  shares edges with no more than k paths in  $F_j$ , where  $i \neq j$  and  $\frac{8 \cdot n \cdot k}{m} \leq 1$ , then there is a way to choose n edge-disjoint paths connecting the n pairs.

#### Proof

Let the probability space be defined by each pair choosing a path independently and uniformly at random from its set of *m* paths.

Introduction Edge Disjoint Paths Edge Disjoint Paths Satisfiability

### Edge Disjoint Paths

Introduction Edge Disjoint Paths Edge Disjoint Paths Satisfiability

## **Edge Disjoint Paths**

### Proof(Cont.)

Let *d* be the degree of the dependency graph. Since event  $E_{i,j}$  is independent of all events  $E_{i',j'}$  when  $i' \notin i, j$  and  $j' \notin i, j$ , then  $d \leq 2 \cdot n$ .

## **Edge Disjoint Paths**

### Proof(Cont.)

Let *d* be the degree of the dependency graph. Since event  $E_{i,j}$  is independent of all events  $E_{j',j'}$  when  $i' \notin i, j$  and  $j' \notin i, j$ , then  $d \leq 2 \cdot n$ . As

$$4 \cdot d \cdot p \leq \frac{8 \cdot n \cdot k}{m} \leq 1$$

## **Edge Disjoint Paths**

### Proof(Cont.)

Let *d* be the degree of the dependency graph. Since event  $E_{i,j}$  is independent of all events  $E_{i',j'}$  when  $i' \notin i, j$  and  $j' \notin i, j$ , then  $d \leq 2 \cdot n$ . As

$$4 \cdot d \cdot p \leq \frac{8 \cdot n \cdot k}{m} \leq 1$$

All the conditions of Lovasz local lemma are satisfied and hence

$$P(\pi_{i\notin j}\overline{E}_{i,j})\geq 0$$

## **Edge Disjoint Paths**

### Proof(Cont.)

Let *d* be the degree of the dependency graph. Since event  $E_{i,j}$  is independent of all events  $E_{i',j'}$  when  $i' \notin i, j$  and  $j' \notin i, j$ , then  $d \leq 2 \cdot n$ . As

$$4 \cdot d \cdot p \leq \frac{8 \cdot n \cdot k}{m} \leq 1$$

All the conditions of Lovasz local lemma are satisfied and hence

$$P(\pi_{i\notin j}\overline{E}_{i,j})\geq 0$$

Hence there is a choice of paths such that the *n* paths are edge disjoint.

## Satisfiability

#### Theorem

If no variable in a k-SAT formula appears in more than  $T = 2^k/4 \cdot k$  clauses, then the formula has a satisfying assignment.

#### Proof

Let there be a probability space defined by some variables that are randomly assigned. Let  $E_i$  for  $i = 1 \dots m$  be an event that the *i*<sup>th</sup> clause is not satisfied by the random assignment.

As each clause has k literals,

$$P(E_i) = 2^{-k}$$

 $E_i$  is independent of all the events related to clauses that do not share variables having clause *i*.

## Satisfiability

#### Theorem

If no variable in a k-SAT formula appears in more than  $T = 2^k/4 \cdot k$  clauses, then the formula has a satisfying assignment.

#### Proof

Let there be a probability space defined by some variables that are randomly assigned. Let  $E_i$  for  $i = 1 \dots m$  be an event that the *i*<sup>th</sup> clause is not satisfied by the random assignment.

As each clause has k literals,

$$P(E_i) = 2^{-k}$$

 $E_i$  is independent of all the events related to clauses that do not share variables having clause *i*.

Each variable in clause *i* cannot appear in more than  $T = 2^k/4 \cdot k$  clauses.

## Satisfiability

#### Theorem

If no variable in a k-SAT formula appears in more than  $T = 2^k/4 \cdot k$  clauses, then the formula has a satisfying assignment.

#### Proof

Let there be a probability space defined by some variables that are randomly assigned. Let  $E_i$  for  $i = 1 \dots m$  be an event that the *i*<sup>th</sup> clause is not satisfied by the random assignment.

As each clause has k literals,

$$P(E_i) = 2^{-k}$$

 $E_i$  is independent of all the events related to clauses that do not share variables having clause *i*.

Each variable in clause *i* cannot appear in more than  $T = 2^k/4 \cdot k$  clauses.

Hence the degree of dependency graph is bounded by  $d \le k \cdot T \le 2^{k-2}$ .
